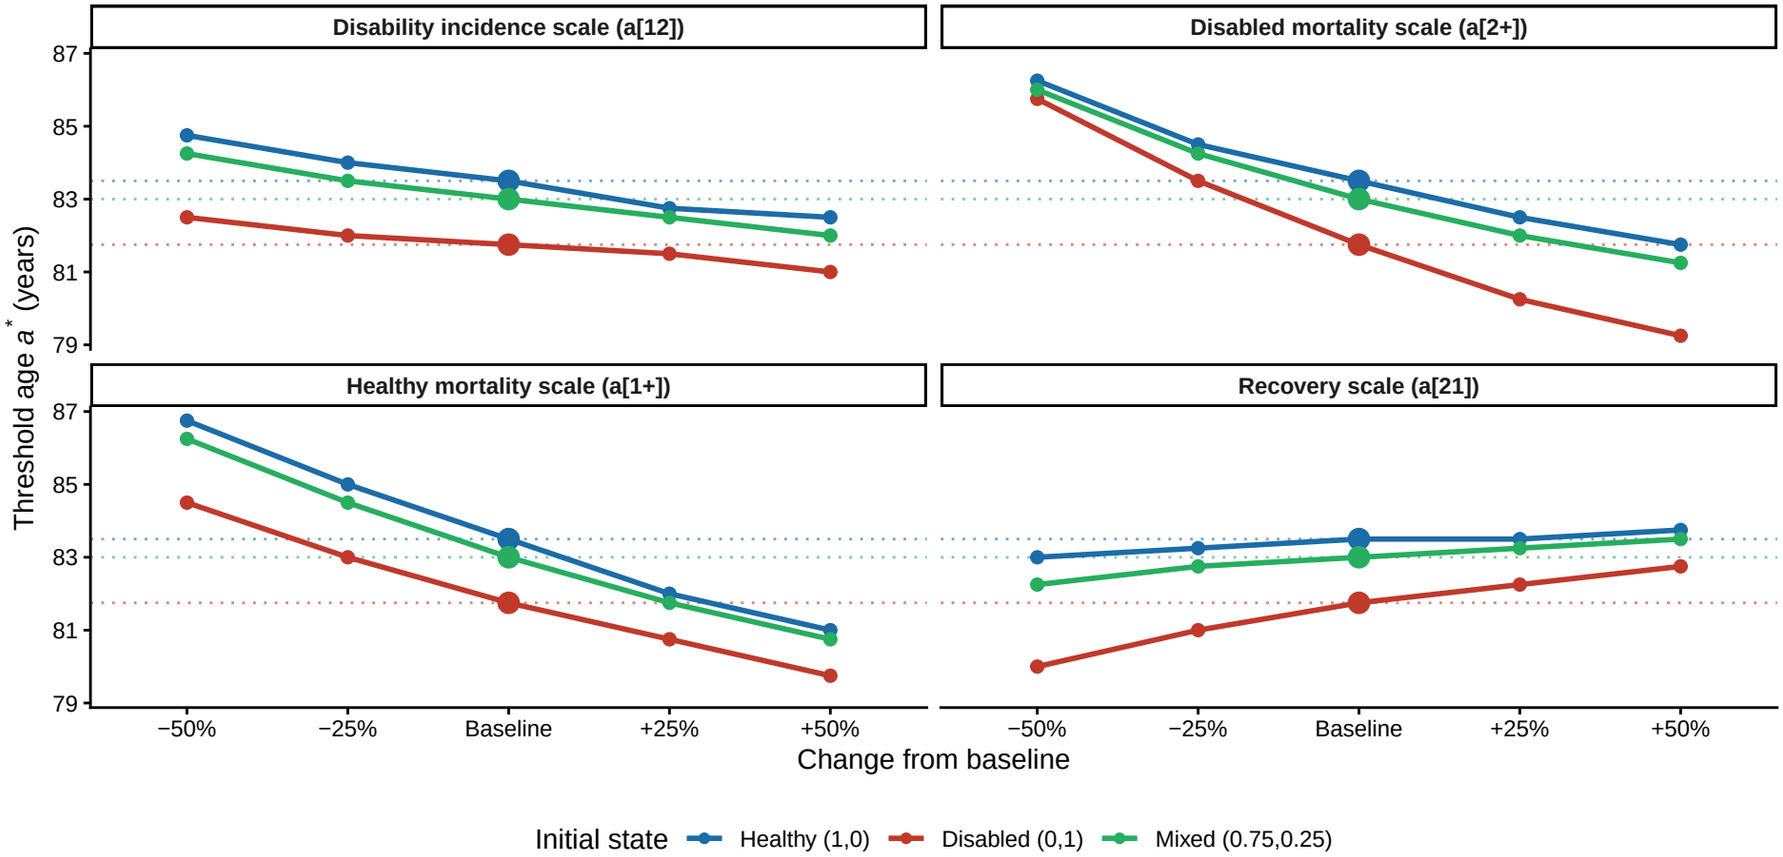
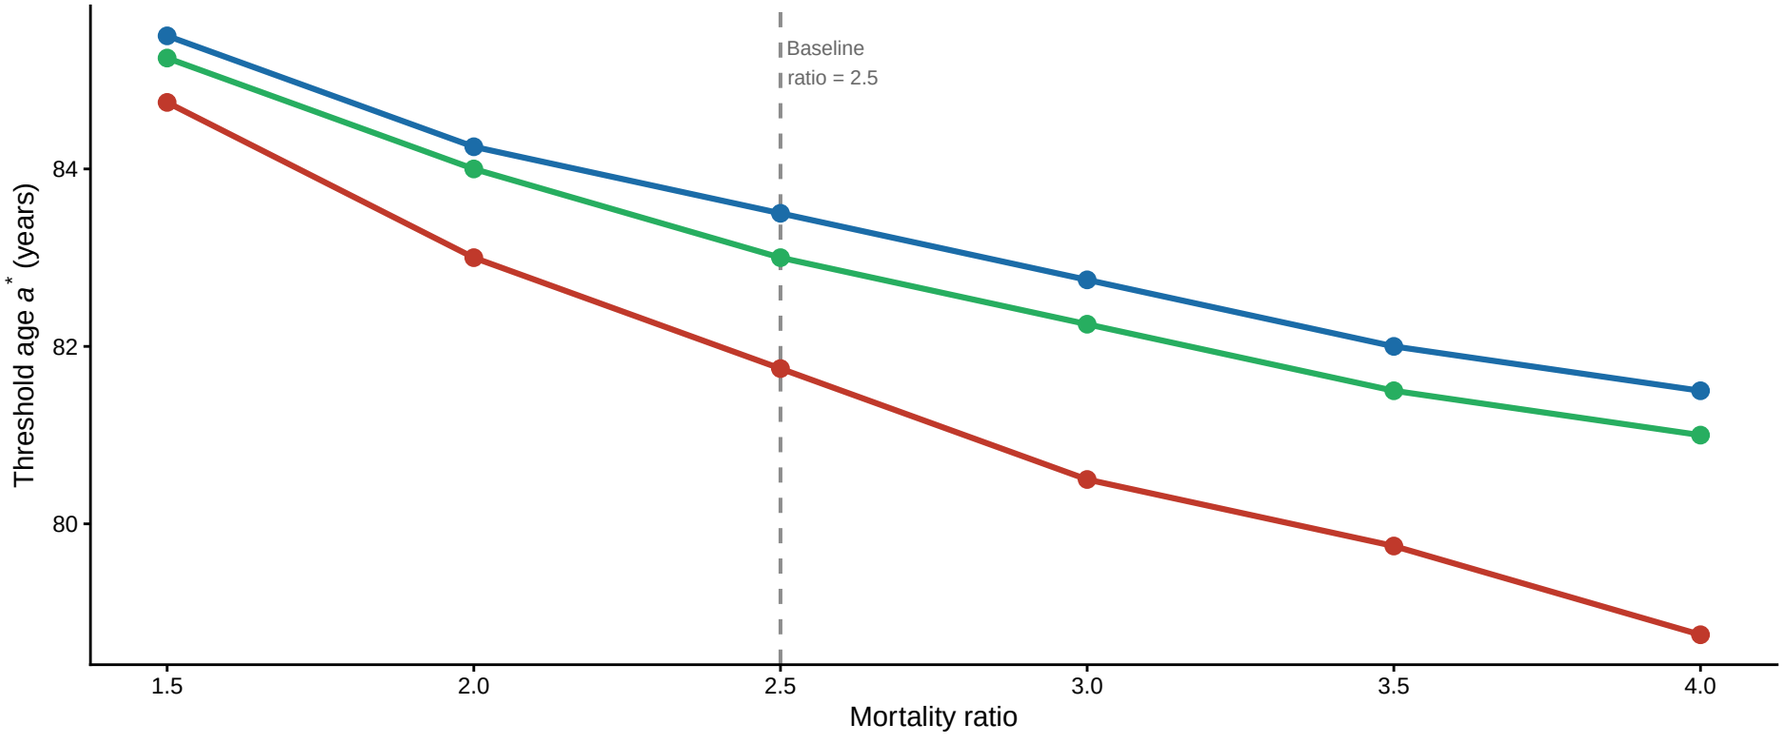
Sensitivity of threshold age a^* to parameter variation

A. One−at−a−time parameter variation



Initial state — Healthy (1,0) — Disabled (0,1) — Mixed (0.75,0.25)

B. Disabled/healthy mortality ratio ($\mu_{2\dagger}$ / $\mu_{1\dagger}$)



Initial state — Healthy (1,0) — Disabled (0,1) — Mixed (0.75,0.25)

Panel A: each parameter varied by −50%, −25%, baseline, +25%, +50%; all others held fixed.
Large points mark the baseline value; dotted horizontal lines show baseline a*.
Panel B: excess mortality ratio varied with mu_{1†} held fixed at its calibrated value.
